

- ◆ **dynaCERT Inc. (DYA-T, \$0.54, Not Rated, Consensus Target: \$2.20):** DynaCERT manufactures and distributes Carbon Emission Reduction Technology (CERT) for use with internal diesel combustion engines that increase fuel economy while lowering emissions. DynaCERT differentiates itself from the pack through its unique synergistic product offering, namely by enhancing the productivity of the machinery to which it is attached. The technology injects trace amounts of on-demand hydrogen into the fuel system for a cleaner burn, achieving 6-19% in fuel savings, while reducing the machinery's carbon footprint by up to 50%. This is also accompanied by the deployment of a recurring revenue stream with data monitoring of the technology. With a growing momentum in cleantech/green energy stocks there haven't been many names left behind

Haywood Top Picks 2021

in the run – with a recent warrant overhang removed, DynaCERT is one that could play catch up with any positive news flow over the coming weeks/few months. The Company's principle target market is diesel engines in long-haul/short-haul trucks. Currently there are 1 Bn internal combustion engines (ICE) world-wide, which are ~90% diesel and this number is growing by 100 MM per year. In a mining operation one truck could burn upwards of ~\$1 MM in diesel per year. This creates a prompt opportunity for DYA as with their technology these mining operations could save 10%, or ~\$100,000 a year, per truck. With a few recent standstill quarters due to shut-in product assembly from March-August in lieu of COVID we still see a worthwhile growth path in the Company's future as they continue pilot projects with customers to gather more data and feedback. This could potentially lead to some big orders with large shipping companies over the next few months, which would immediately put the stock onto a lot of radar screens.
